Appendix 4 – Version 2.x Command Line Interface Options

If you have more than one option you'll need to put 'everything in quotes like this'. For example

lottievectors -help -bugs, wont work but

lottievectors '-help -bugs' will..

< path/filename > Load vector data file. (.dat default extension if none)

1 to 99   Load a preferences file with that number at start

0   Load the built in defaults, skipping preferences

[display options] :

        -nodisplay   Don't use the figure window, text only

        -nocontrols   Start with no controls around the border

        -controls   Start with all controls on the window

        -turbo   Begin in turbo, fast display mode

        split   Begin in split screen mode

[vectors options] :

        -noroute   Don't display red dotted route line

        -noforce   Don't display any forces

        -asnumbers   Show vector's index numbers (for editing)

        -nonegz   Don't go below zero in 3D, -100 is as 100

        -nofancyarrows   Display slightly simpler arrows for forces

[data options]   :

        -xposmap   Position map is X Based

        -yposmap   Position map is Y based

        -noposmap   Don't display the Postition map at startup

        -posmap   Display the Position map when starting

        -list   Display a list of vectors at the start

        -nolist   Don't list vectors at the start

[program options] :

        -about   General information about the software

        -version   Actual version of your program

        -bugs   Where to report bugs to
